

## HOUSE OF WORSHIP

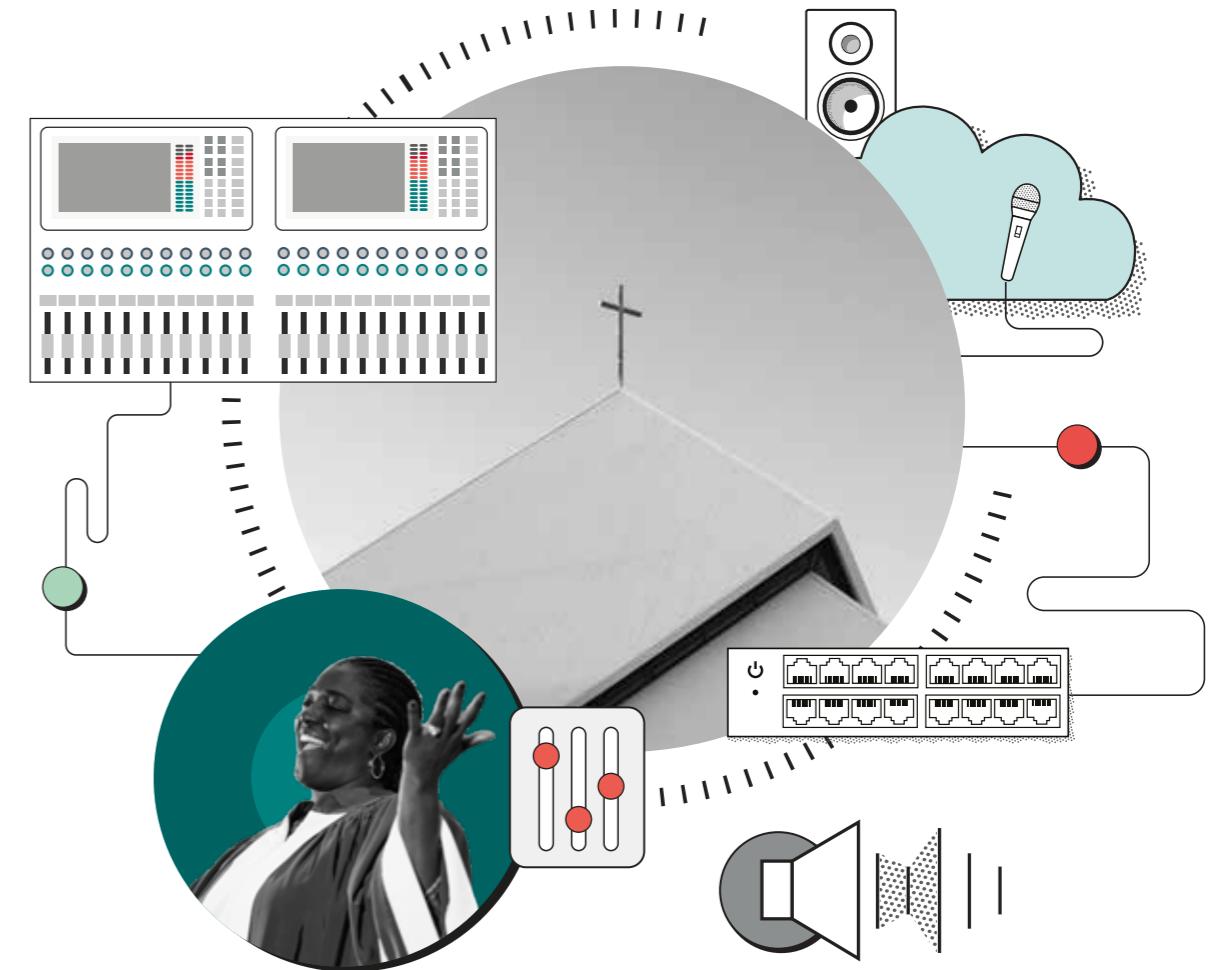

### Application Diagram

Houses of worship have demanding AV needs — from speech and live music to video feeds and overflow rooms. Services are often streamed or shared across multiple spaces, requiring a system that can handle diverse inputs and destinations with ease.

With Dante, audio and video connectivity come together on a single, flexible network using standard switches and affordable Ethernet cabling. Route signals freely between the stage, mixing console, PA, and monitors, or extend them to recording, streaming, and overflow areas anywhere in the building or across campuses. It's a powerful yet straightforward way to keep every message clear and every moment in sync.

### Reliable Management for Growing AV Systems

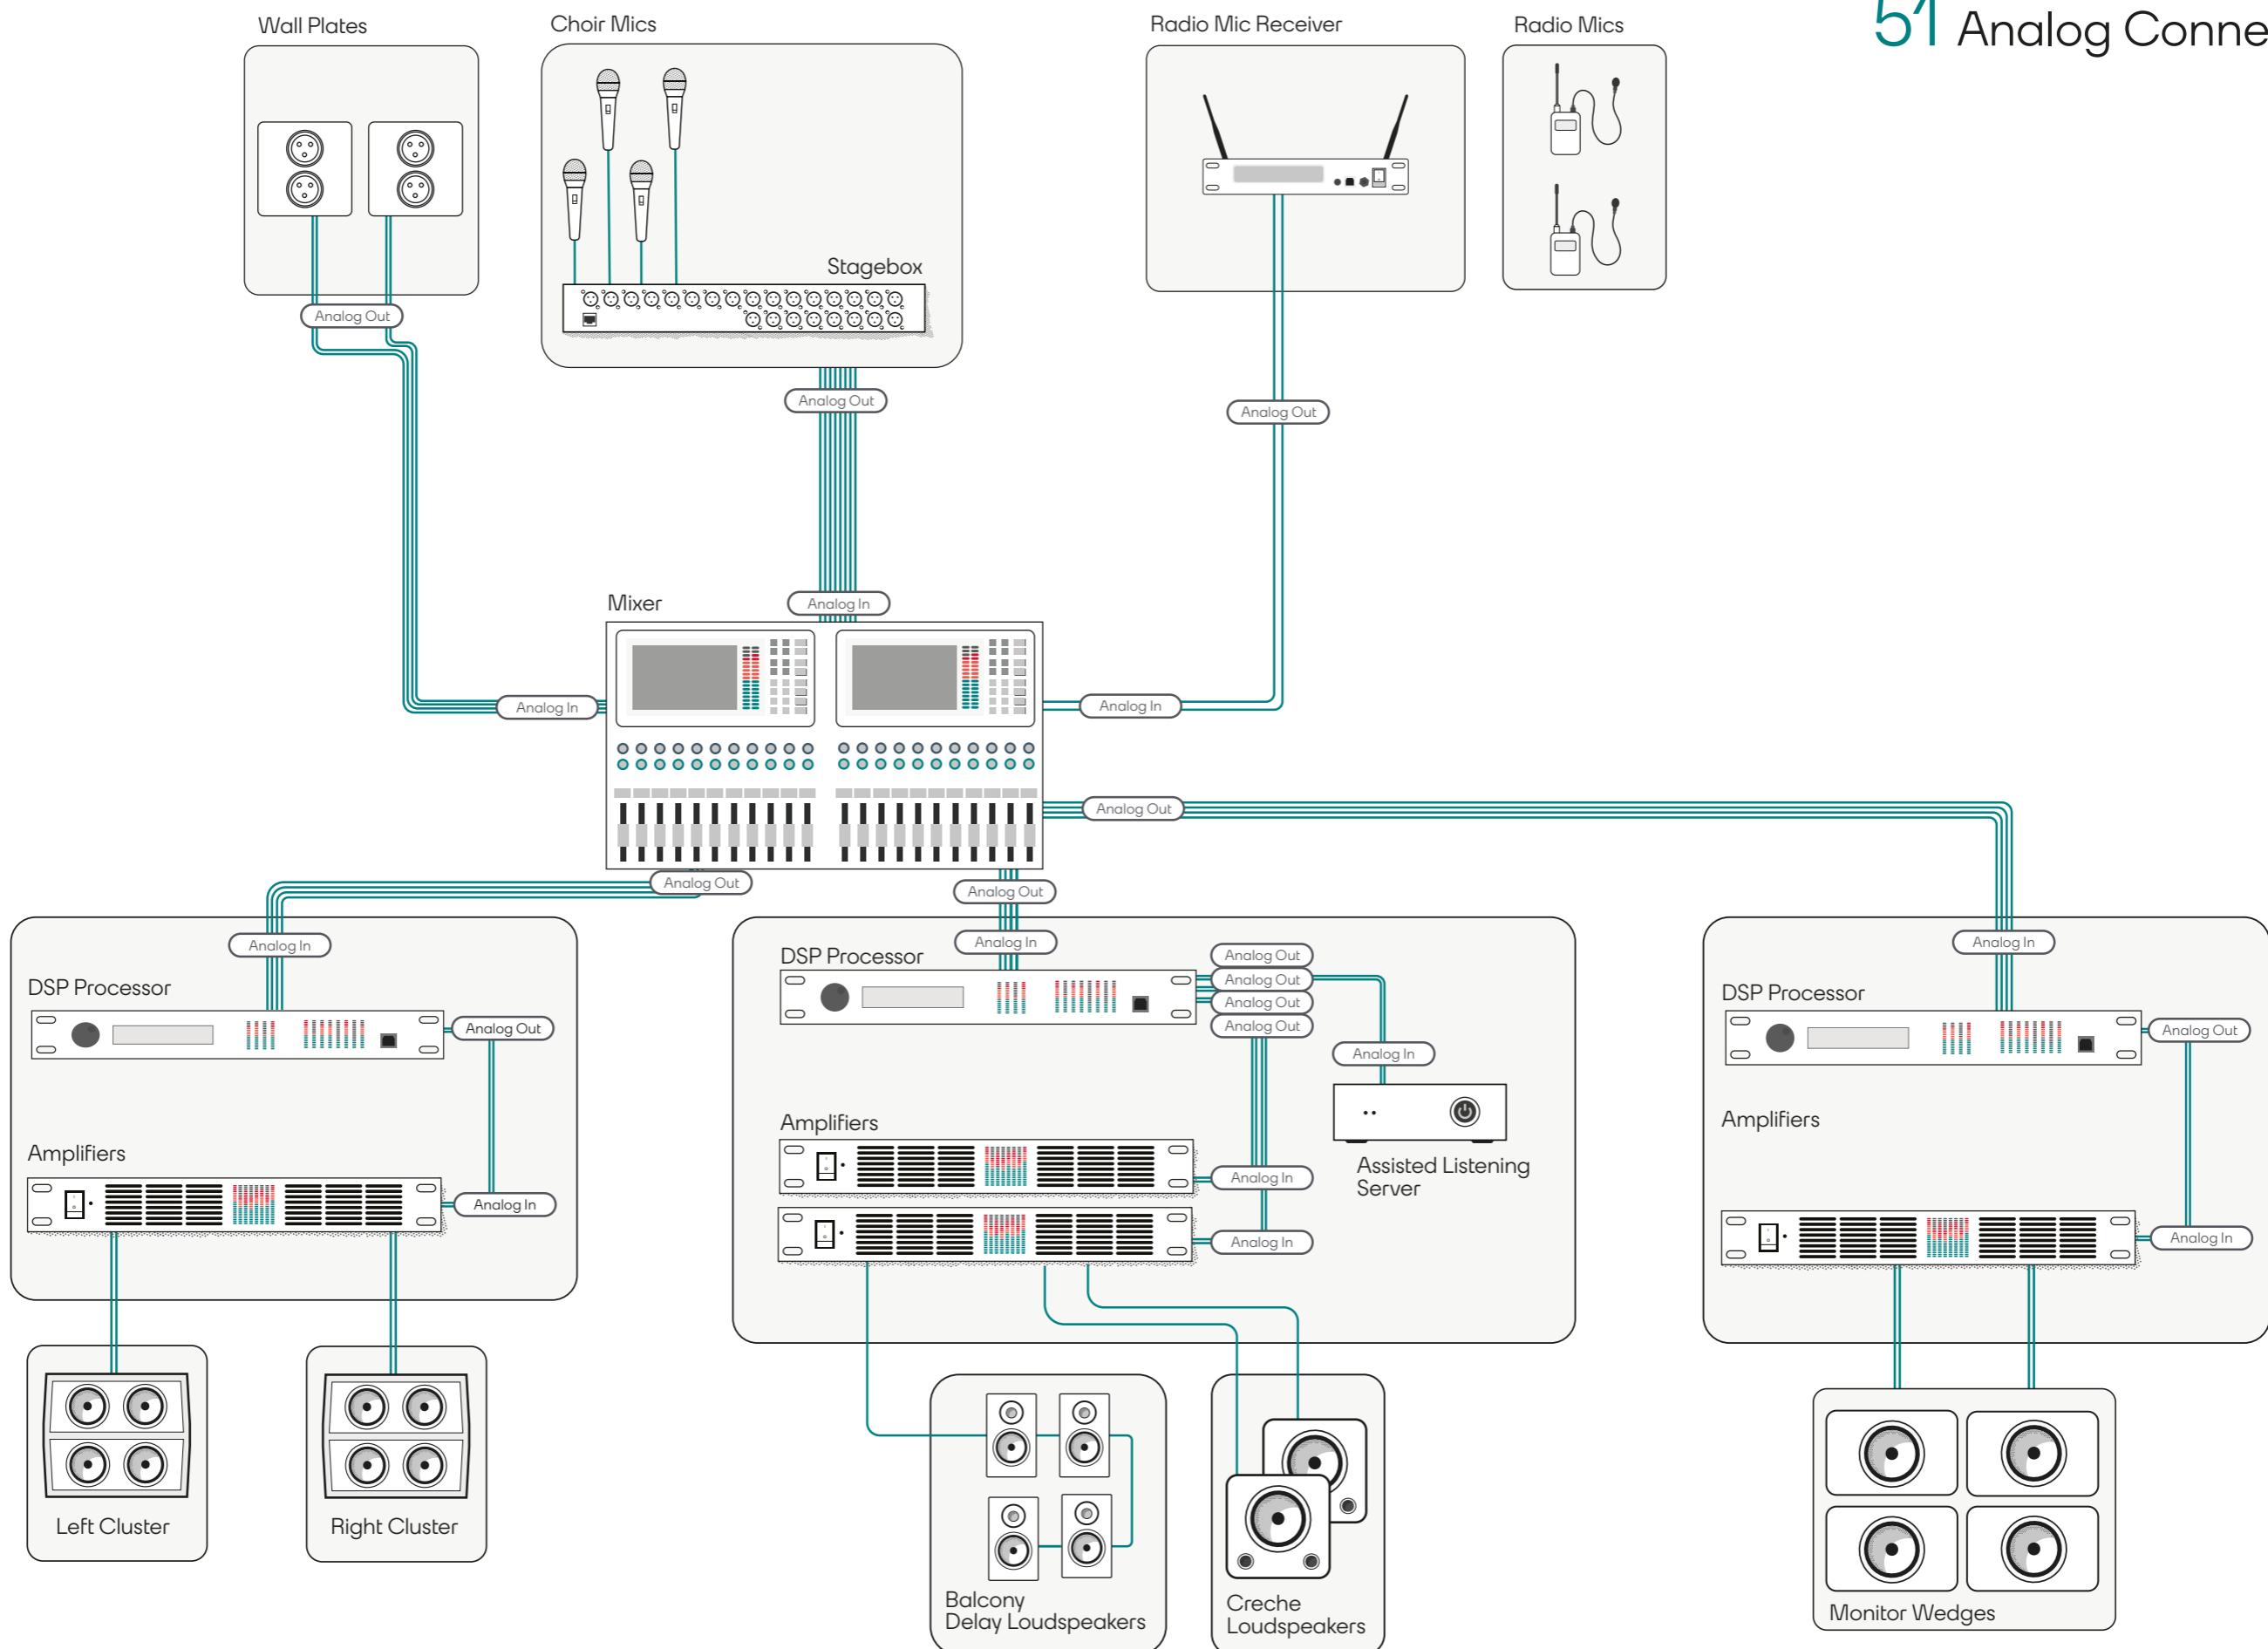

As AV systems in houses of worship grow to include multiple rooms or campuses, managing everything becomes complex. Dante Director brings it all together in the cloud — eliminating the need to maintain on-site servers while giving technical teams complete visibility and control from anywhere. User access control ensures volunteers and staff only see the parts of the system relevant to them, helping prevent misconfigurations or accidental changes. API integration further simplifies operation for any level of user, allowing single-button routing from control panels and Stream Decks. The result is a system that stays organized, responsive, and ready for every service.
